

REGENERESSEN® in Biocybernetic Medicin

Hans-D. Gosau

Rheda-Wiedenbrück

Biocybernetic medicin utilizes the human informatics system for diagnosis and therapy, using effects that can be triggered by the transfer of information.

The basic principle of biocybernetic medicin is the well known concept of the self-regulating circuit. Many such circuits and their respective functions are superimposed in the biological organism. All influences on a circuit, including pathogenous ones, form the disturbing factor. As with the regulation of room-temperature, the disturbing factor is the reason for the necessity of a correcting mechanism. This disturbing factor in the human organism can be exogenous as well as endogenous, in both cases having a negative effect on the regulating entity.

Because biocybernetic medicin works by influencing the impaired regulating mechanism by the transfer and re-transfer of informations, this method seldom uses substantial effects. Regulation is influenced rather by a flow of information than by a flow of substance, which is also true for the elimination of disturbances. Therefore the application of REGENERESSEN is an exemption of the usual biocybernetic therapy, which is generally restricted to information transfer.

However, the role of the REGENERESSEN is to strengthen the regulating entities, i. e. the organs with an impaired regulation characteristic, thus enabling the regulating flow of information to take a better and quicker effect. (Besides, the REGENERESSEN as RNA-molecules have not only a substantial or substituting effect, but are carriers of information as well. Suppl. by the translator.)

The referent mostly uses *RN13* or *Osteochondrin S* as basis of the REGENERESSEN-treatment, supplemented by the organs or organ systems affected in each special case. For testing the choice of organs and for controlling the success of the therapy, he uses the decoder-dermograph according to Jahnke.

Several cases with a wide range of indications were reported; all had in common a resistance to conventional treatment. In all cases the individual application of REGENERESSEN combined with the biocybernetic treatment effected a permanent success.
